- Authorized to work in the U.S. for any employer — no sponsorship required

SUMMARY

Python software engineer focused on backend systems and automation. Since mid-2024 I have shipped and supported production software for paying clients — from the website of an internationally awarded photographer to scrapers, Telegram bots and workflow automation — and in 2025 built Python microservices on Springer Capital's backend team. Strongest where requirements are still fuzzy: turning the problem into a clear plan, picking the simplest design that holds up, and owning it after launch.

TECHNICAL SKILLS

Languages	Python, SQL, JavaScript / TypeScript, C#, Java
Backend	Django, Django REST Framework, FastAPI, Flask, REST API design, SQLAlchemy, Alembic, JWT authentication
Data & Infra	PostgreSQL, SQLite, Docker, Git / GitHub, Pytest, Postman, Vercel, Render
Frontend	React, TypeScript, Tailwind CSS, HTML / CSS, responsive and mobile-first UI
AI & Automation	Gemini API, Ollama, LLM integration, Stripe, web scraping, Telegram Bot API
Spoken	English (professional), Ukrainian (native), Russian (native), Polish (intermediate)

EXPERIENCE

Freelance Software Developer · Independent

Jun 2024 – Present

Remote · Web, backend and automation projects, owned from the first client call to production support

- ◆ Andriy Rochnyak Photography (andriyrochnyak.com): designed, built and maintain the production site of an internationally awarded fine-art photographer in React, TypeScript and Tailwind CSS: reusable galleries, mobile-first layouts, optimized loading of high-resolution images and SEO metadata. Own Vercel deployments, QA and every release since launch.
- ◆ Built Python web scrapers that extract, clean and structure data from client-specified sources, replacing hours of manual collection with repeatable scripts.
- ◆ Developed Telegram bots and Python automation tools that run unattended: notifications, user commands, routine operations.
- ◆ Lead each engagement end to end: requirements, architecture, build, testing, deployment and post-launch support.

Backend Developer Intern · Springer Capital

2025

Remote · Real Estate Investment & Advisory

- ◆ Developed features in Python microservices powering internal business workflows: REST endpoints, request validation, authentication, filtering and pagination over PostgreSQL.
- ◆ Built integrations with Google and Microsoft services, normalizing meeting data from both platforms into one consistent schema consumed by downstream workflows.
- ◆ Diagnosed backend defects end to end by reproducing requests, tracing logs and inspecting database state, and protected each fix with Pytest regression tests.
- ◆ Shipped through the team's Docker and Git pull-request workflow; documented services for clean handoff.

FEATURED PROJECT

Rosha Club ([CapstoneGym](#)) — Membership Management Platform

Live in production

Django · DRF · PostgreSQL · Stripe · JWT · Gemini · Ollama | capstonegym.onrender.com · [GitHub](#)

- ◆ Architected and shipped a full-stack membership platform on Django REST Framework and PostgreSQL, with a relational model for users, memberships and payments, JWT auth, protected workflows and dashboards.
- ◆ Designed the payment lifecycle around confirmed Stripe events, so access is granted only after Stripe verifies payment — failed or abandoned checkouts never unlock a membership; every protected action is validated server-side with ownership checks.
- ◆ Built an in-app AI assistant on Gemini and Ollama that answers using live application context, backed by persistent chat history, response caching, rate limiting, timeout handling and per-session ownership rules.

EDUCATION & CERTIFICATIONS

Vistula University — Computer Engineering, Warsaw, Poland
Two years of bachelor-level coursework: Algorithms & Complexity, Databases, OOP, Web Technologies, Operating Systems, Networks

CS50 Web Programming with Python & JavaScript — HarvardX
Foundational C# with Microsoft — freeCodeCamp
