

ROMAN ROCHNIAK

PYTHON SOFTWARE DEVELOPER

Akron, OH | [330-715-5740](tel:330-715-5740) | rochnyak180405@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

Authorized to work in the U.S. for any employer - no sponsorship required

SUMMARY

Python Software Developer who likes building the part of a product people do not see but depend on every day: backend logic, APIs, data flows, and integrations. I have worked on Python microservices in a team environment and delivered a production client website from the first requirements to ongoing releases. I am used to taking a feature or bug, understanding the business need behind it, working through the code and data, testing the result, and documenting the important parts. I care about backend code that is practical, reliable, and clear enough for the next engineer to work with confidently.

TECHNICAL SKILLS

Main stack: Python, Django, Django REST Framework, FastAPI, Flask, PostgreSQL, SQLAlchemy, Alembic, Docker, Git/GitHub, Pytest

Additional technologies: React, TypeScript, JavaScript, Tailwind CSS, Stripe, Gemini API, Ollama, AWS S3, Render, Neon, Vercel, Linux

EXPERIENCE

Backend Engineering | Springer Capital | Real Estate Investment & Advisory

2025

- Built and contributed to three Python microservices used in real internal workflows, working with backend logic, REST endpoints, structured data, PostgreSQL, tests, and technical documentation.
- Worked on a meeting-data service that connected with Google and Microsoft tools, collected meeting-related information, normalized it, and packaged the important results into a structured format that could be used by other internal workflows.
- Worked on a financial-operations service that validated and processed internal financial data, applied business rules and calculations, and exposed the results through backend workflows without exposing confidential business details.
- Built an employee-operations service for employee, attendance, and performance workflows, including authentication, validation, filtering, pagination, and database-backed business logic.
- Containerized service components with Docker, worked through branches and pull requests, supported CI/CD-oriented handoff, maintained API documentation, and added Pytest coverage around backend behavior.
- Investigated production-style backend issues by reproducing requests, tracing application behavior and logs, checking database state, and verifying fixes with tests. Fixed a date-range issue that excluded boundary records and added regression coverage around the corrected behavior.
- Learned internal frameworks and team conventions independently, worked through Git-based collaboration and reviews, and wrote clear documentation so service behavior and handoff were easy for other engineers to follow.

Freelance Software Developer | Professional Photography Client | [LIVE WEBSITE](#)

2025 - Present

- Worked directly with the client from the first design conversations through implementation, launch, and ongoing updates, turning visual ideas and feedback into concrete product decisions and releases.
- Built the production website around the way professional photography needs to be presented: large image collections, strong visual hierarchy, reusable galleries and sliders, lightboxes, smooth transitions, and layouts that remain easy to use on desktop and mobile.
- Handled the main technical tradeoff of the project - keeping high-resolution images visually strong without making the site feel slow - by improving loading behavior, image delivery, page structure, metadata, and the way galleries are rendered.
- Iterated on content structure, metadata, SEO details, and mobile behavior after reviewing the live site with the client, making practical changes instead of treating the first release as finished.
- Owned deployment and production support, including Vercel releases, custom-domain setup, cross-device checks, issue fixing, and follow-up changes requested after the site was already live.

SELECTED PROJECT

Rosha Club / CapstoneGym | Django, PostgreSQL, Stripe, Gemini/Ollama | [Live App](#) | [GitHub](#)

- Built and deployed a membership platform with authentication, trainer and program management, relational data models, membership states, dashboards, community features, and administrative workflows.
- Designed a Stripe payment flow that changes membership state only after confirmed payment processing and handles success/failure paths rather than trusting the browser alone.
- Built community and account workflows with ownership checks, protected actions, and asynchronous UI updates so users could interact with posts and account data without breaking backend permissions.
- Integrated an LLM assistant with persistent chat history, contextual application data, caching, rate limiting, timeout handling, and ownership checks so conversations remain tied to the correct user and session.

EDUCATION

Vistula University | Computer Engineering | Bachelor's Program | Warsaw, Poland

Coursework included software engineering, object-oriented programming, algorithms and complexity, databases, web technologies, operating systems, computer networks, computer architecture, and related engineering foundations.

Programming languages used during the program: Python, Java, C#, JavaScript, and SQL.

Certifications: [CS50 Web Programming - HarvardX](#) | [Python Mega Course - Udemy](#) | [Postman API Fundamentals - Postman Academy](#) | [Udemy Course Certificate](#)

Languages: Ukrainian (Native) | Russian (Native) | English (Professional working proficiency) | Polish (Conversational)
